

RF LICENSING SERVICE

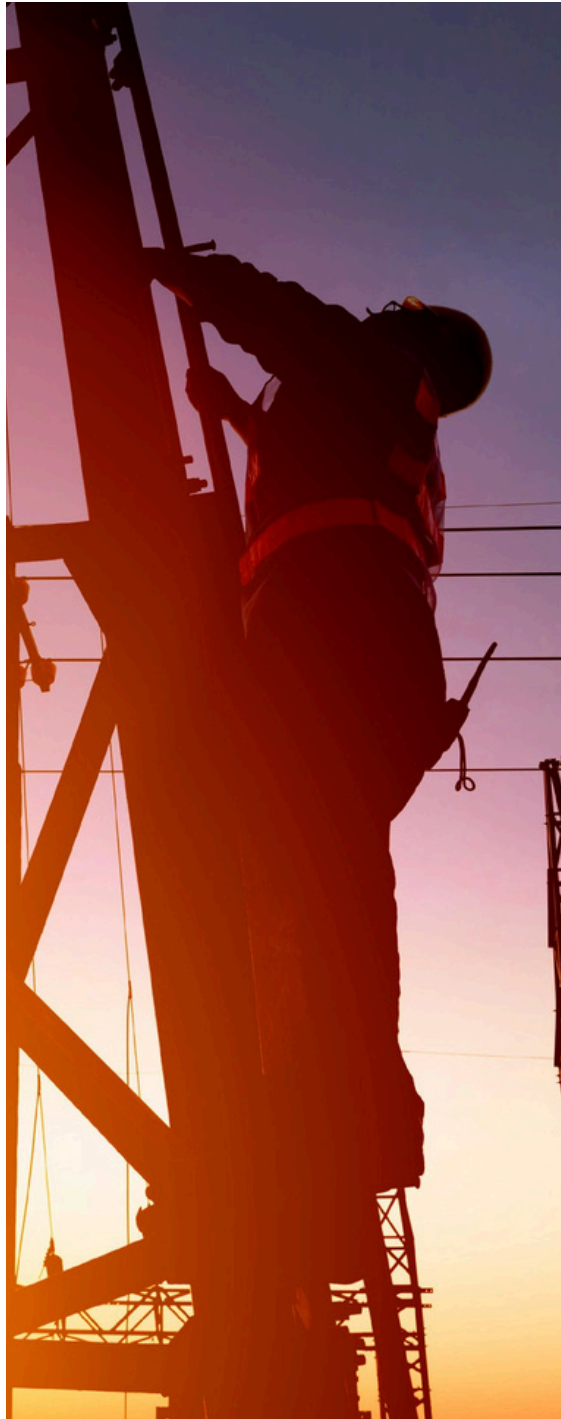

RF spectrum is a national resource requiring regulation and mapping to mitigate radio spectrum pollution and to maximize the benefit of usable radio spectrum.

Every country has a regulatory authority designated to manage the RF spectrum by means of licensing. Prior to the use of any frequency band by any radio operator, it is mandatory that the use is registered with the designated authority and a license obtained.

Ubiik now offers a service to manage RF frequency licensing on behalf of our customers.

CONVENIENCE & TIME-SAVING

If your organization doesn't have the in-house resources with the time or capability to manage this process, Ubiik can now take care of it for you. Using site information, tower locations and antenna details gathered for preliminary path planning and design projects, our team can manage the licensing with your local regulatory authority.
